

Movie Ticket Booking Management Application

Congratulations on completing your application definition! This document presents a summary overview of your application as defined in the Pega platform. It encapsulates the key elements of your application's design, highlighting its core functionalities and overall structure.

Please note that this is a high-level view and does not include granular details like data models or sample data. It's an ideal resource for a quick reference, facilitating discussions among team members and stakeholders, and for guiding strategic decisions in your application development process.

Blueprint ID: BP-2412289

Application Context

This application manages the end-to-end movie ticket booking process for CineWave Entertainment. Customers submit a booking request by providing the movie name, show date, show time, and number of tickets. The system then checks seat availability for the selected show and calculates the total booking cost based on ticket price and quantity. Once availability is confirmed, the customer reviews the full booking summary and either confirms or cancels the request. On confirmation, the system allocates seats, generates a ticket ID, and automatically routes the booking to the appropriate processing queue: Premium or Standard, based on show type. The application also maintains reusable movie and show data for consistency across bookings, enforces a service-level agreement to ensure bookings are processed within two days, and sends an automated email notification to the customer once the booking is confirmed, including the case ID, show details, seat numbers, and total cost.

Application Architecture

Users access the application through defined channels, assume specific roles, and trigger workflows that manage how work progresses. Those workflows operate on shared Data Objects to ensure the system stays consistent and up to date.
